We Inform The Mysteries
As Much As They Inform Us

June 2021 Celestial Timings

by Cayelin K Castell

Done is Better than Perfect – Especially During Mercury Retrograde ☺

We begin June in the midst of a Mercury Retrograde that lasts until June 22 and an Eclipse Cauldron that began with the May 26 Total Lunar Eclipse and the June 11 Annular Solar Eclipse/Ring of Fire <https://cayelincastell.com/solar-eclipses-new-timeline/>. These Eclipses are accelerating our desire to step even more boldly into the Spiritual Quest for greater Truth and Meaning letting go of our current reality in favor of co-creating a New Earth Reality based in Love, Light, Joy, Bliss, Magic, Miracles, Courage, Kindness and Compassion through playful creative FUN!

This suggests it might be helpful to revisit some things I have shared in the past from *The Mysteries of the Great Cross of Hendaye – Alchemy and the End of Time* by Jay Weidner and Vincent Bridges. This book explores the galactic super wave or the galactic energy bursts coming from Galactic Center at certain time intervals.

The galactic superwave, composed of superhot cosmic-ray particles traveling at close to the speed of light, would appear from Earth as a brilliant blue-white spot of light – about the size of Mars – in (the constellation) Sagittarius (also known as the Archer), surrounded by a slightly larger and less bright halo. This source, perhaps as much as a thousand times brighter than any star, would be visible even in daylight. <http://www.sangraal.com/AMET/index.html>

Myths from around the world are encoded with astronomical information about planetary cycles, seeming disasters, and other shifts in the heavens such as Zeus (Jupiter) overthrowing his father (Saturn) describing when Jupiter catches up to Saturn every 20 years, or the story of Sekhmet (the daughter of Ra, the Egyptian Sun God) scorching the Earth with her fury or the tale of the Mahabarata describing a war between the gods that scorched the Earth thought to be describing a previous great shift in time.

Interestingly, Hopi legend speaks of the Blue Star Spirit or [Blue Star](#) Kachina that closely matches the description of the galactic pulse or superwave as described in the Great Cross of Hedaye.

Toltec and Aztec wisdom says we are leaving the time of the 5th Sun and entering the time of the 6th Sun representing a more Yin or receptive energy leaving the more Yang or aggressive energy of the past 6,625 years.
<https://www.healyourlife.com/2021-heralds-the-dawning-of-a-new-age-the-age-of-the-sixth-sun>

The End of Time and the Beginning of a New Time

Dieter Broers author of [Solar Revolution: Why Mankind Is on the Cusp of an Evolutionary Leap](#) describes it as a new beginning we haven't yet imagined. The Earth and our entire solar system is receiving more light codes or photon energy via the Sun and the comets and the Galactic core than in any previously recorded time we know of.

In 1997 Alexey Dimitreiv published information showing all the planets in our solar system are dramatically increasing signs of energetic activity, including atmospheric pressure, brightness from the Aurora Borealis, magnetic field strength and cataclysmic activity. This suggests that our entire solar system is experiencing this increased hyper-dimensional energy.
<http://tmgnow.com/repository/global/planetophysical.html>

Here is another perspective from Kirael *The Great Shift*

Photon energy is the powerful new energy source that will replace electricity in the new millennium. It's a free energy source and nobody can monopolize it. Its outer edge or belt has already reached Earth's atmosphere and is affecting not only Earth but many planets in the solar system.

Photon energy is light energy, and it permeates the Earth in waves. It has the power to extend human life because it realigns the human body into a lightbody. Photon energy vibrates at a very high frequency and confers the power of instant manifestation of thought. Therefore, it is essential to maintain clarity and purity of thought by practicing daily meditation, being in the "now," and staying heart-centered.

In one sense, the Great Shift in Consciousness is the evolution of Mother Earth and her inhabitants into the realm of photon energy for the next 2,000 years.

For a full explanation of photon energy and the evolution of consciousness, see Chapter 4 in *Kirael: The Great Shift* Revised Edition. <https://www.kirael.com>

All this suggests it has never been more important to focus our attention and intention on what we would like this New Time to be like. For me this includes moving away from the competitive destructive model we have been living with, energizing a loving, cooperative constructive model where all our needs are easily met and we are joyously celebrating the kind, caring, magical gifts we each bring to this New Time. Thank You! Aho! Gracias! Mahalo! Etc...

June 2021 Sky Happenings

We begin June with Mercury Retrograde until June 22 (see this 10 minute video with insights into Mercury Retrograde https://youtu.be/i_2d_u8lJig and Venus within 10 degrees of Mercury until June 06 representing the Return of the Divine Feminine a.k.a the Shekinah <https://cayelincastell.com/venus-and-mercury-return-of-the-shekinah/>)

June 10, Thursday. Ring of Fire Solar Eclipse as described by earthsky.org <https://earthsky.org/tonight/annular-solar-eclipse-on-june-10-2021/>

And this 7 minute video gives insights on how to work with the Ring of Fire Annular Eclipse <https://youtu.be/EOmVUNNqWRk>

June 11, Friday. Features the second Venus Moon conjunction visible in the evening sky representing the sacral chakra gate. The Moon is about a day and half into its new cycle and is 2.3% illuminated, sitting 3° lower right of Venus shining at the -3.8 Magnitude at dusk Just 10° above the horizon.

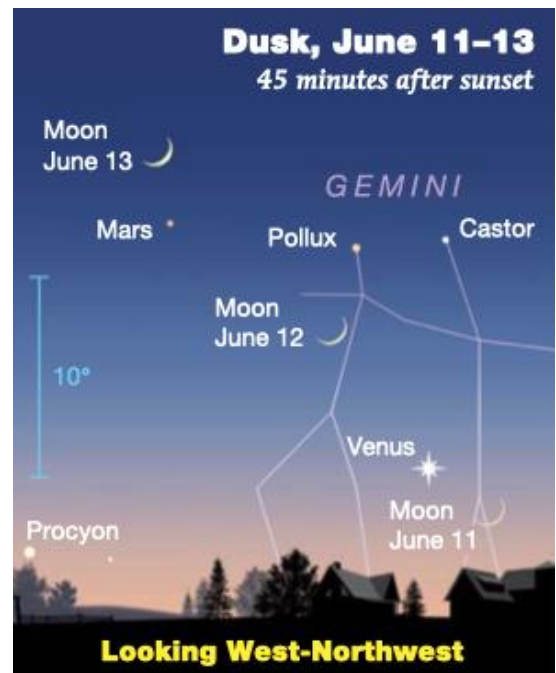

You will still need a fairly low horizon line to see Venus and the Moon in the West North West.

Venus is Out of Bounds from May 23, 2021 at 08:05 am PDT until June 18, 2021 at 02:12 am PDT. (maximum is 24 degrees 26)

Find out More about Out of Bounds Venus here <https://cayelincastell.com/wild-cards-or-the-out-of-bounds-planets/>

Eclipses in 2021

 May 26	Lunar Eclipse (Total)	South/East Asia, Australia, Much of North America, South America, Pacific, Atlantic, Indian Ocean, Antarctica	
 Jun 10	Solar Eclipse (Annular)	Much of Europe, Much of Asia, North/West Africa, Much of North America, Atlantic, Arctic	
 Nov 18–19	Lunar Eclipse (Partial)	Much of Europe, Much of Asia, Australia, North/West Africa, North America, South America, Pacific, Atlantic, Indian Ocean, Arctic	
 Dec 4	Solar Eclipse (Total)	South in Australia, South in Africa, South in South America, Pacific, Atlantic, Indian Ocean, Antarctica	

To learn more about the significance of this Venus Moon conjunction and how to work with it ceremonially check out the Venus Alchemy evening star journey by clicking on the image below.

Venus Alchemy Journey
with the New World Story Teller
Rainbow Gemini Goddess Initiation

No Previous Knowledge of Astrology Is
Necessary to Be a Part of This Ceremonial Journey

The Journey Begins May 02, 2021
Details are here
<https://venusalchemy.com/gemini-evening-star-sales-page-2021/>

June 13, Sunday. Similar to the May Moon Magic after being with Venus on June 11 the Moon catches up to Mars and passes the red planet on June 13 due to Venus rapidly catching up to Mars (exact in July) the Moon is with Mars only two nights after have been with Venus.

In July Venus and Mars are so close to each other - the Moon will visit them both on the same night.

On June 13 however the lunar Crescent is a little less than 3° above Mars at a magnitude of 1.8 or half as bright as Pollux in the consolation of the Twins. Pollux is about 10° to the right of Mars.

June 20, Sunday. The June Solstice is exact at 8:32 PM Pacific time or 11:32 PM eastern time. More on the Solstice. More here <https://cayelincastell.com/celebrating-the-solstices/>

The Sun is on the Galactic Cross within the Sacred Hoop of Stars on the June Solstice. More here <https://cayelincastell.com/june-solstice-magic/>

June 21, Monday. As Venus moves along the ecliptic it is passing near the 1.2 magnitude star Pollux in the constellation of the Twins. At dusk the two are only separated by 5° . On the evening of June 24 and 25th Venus will be in a direct line with Castor and Pollux spanning about 12° parallel to the WNW horizon. <https://cayelincastell.com/the-twins-castor-pollux/>

June 22, Tuesday. The Moon is passing the bright red star Antares in the Scorpion.

This month Antares also is the brightest star the Moon gets closest to though the Moon does pass nearly as close to Regulus on the evening of the June 15.

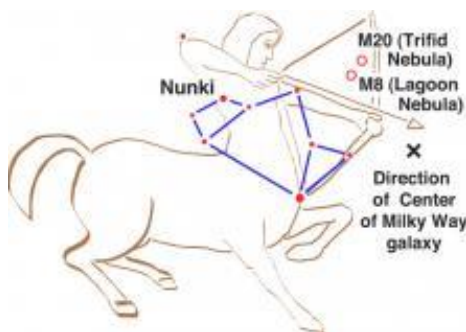

June 23, Wednesday. Mars at 1.8 magnitude is moving through the center of the Beehive Cluster on June 23. To see this you will most likely need binoculars and look low in the WNS starting about 90 minutes after sunset. From mid northern latitudes the planet and cluster are just 7° above the horizon as twilight deepens and sets soon after. Mars is near this cluster from June 22-24 so you have a couple of backup opportunities in case of clouds on the 23rd.

When Planets are passing the Beehive Cluster (7 Leo) we are reminded of Bee Blessings that come from many ancient Goddess or Divine Feminine symbols.

Bees matter and are essential to the whole. Environmentally, Bees are vital to the health and well-being of our planet pollinating flowers and crops so they can reproduce. This is why Bees are considered a fertility symbol. Bees also teach us about enjoying the blessings of nectar or sweetness of life.

A good question to consider is ... Are you enjoying the sweetness of life? If not what can you do to change that?

On the morning of June 25 if you live in the western half of the US or in Mexico you'll see an occultation of the Moon over Nunki a star that marks the vane of the Arrow in the constellation of the Archer – pointing directly to Galactic Center. Nunki shines at 2.1 magnitude

From most of the western half of the US and Hawaii the 15 1/2 day old Moon will cover the star. For other locations further east of the event occurs in morning twilight or around sunrise.

August 18 and 19 (when the Moon is 11 days old) a slim section of the far southern US, Central America and Northern South America will see the star disappear once again.

June 27, Sunday. After opening the month by visiting Jupiter and the Moon is book ending by closing in on Saturn. And the predawn hours the waning gibbous Moon is within less than 5° below Saturn shining at +0.4 magnitude. Both objects are found right in the middle of the Goat Fish a.k.a. Capricornus.

Of course the brilliant Moon will make it difficult to see most of the stars in this part of the sky.

Meteor Showers

June 7 the Arietids peak and are favored with a New Moon Eclipse on June 11 though it helps to be near the equator to see them.

June 15 Lyrids peak though not much has been observed from them in recent years. Look towards bright star Vega in the Summer Triangle and the Pole Star 13,000 years ago.

June 27 Bootids peak best observing in Northern Hemisphere. Look to constellation Bootes where Arcturus is located. This one is known for very slow meteors.

June Sky Worth Noting

This month the Milky Way lies to the south at night and the constellations the Sun moves through during the winter are easily visible, including the Scorpion, the Archer, the Scales (where Saturn is located) and the Virgin Priestess (where Mars is still located).

Also prominent this month are seven main stars of the constellation of the Virgin Priestess (a.k.a. Virgo), Vindemiatrix, Zaniah, Porrima, Zavijava, Khambalia, Auva, and Spica.

The most visible star in this group is the bright bluish white star Spica, "spike of grain" where the Moon is on June 19 this month.

Higher in the sky and a bit to the right of Spica is the star Denebola marking the lion's tail in the constellation also known as Leo. If you follow a direct line from Spica to the upper left you will see the bright red star Arcturus, creating what is known as the Spring Triangle.

Arcturus in June

Arcturus is beautiful to see in the June night sky. Some feel it is the most distinctive of all the skies bright stars. Using the handle of the Big Dipper you can arc to Arcturus.

Arcturus is a -0.5 magnitude star making it the fourth brightest star in our night sky. However sitting at a number three is Alpha Centauri using a combination of two stars at magnitude -0.1 and 1.35. If you treat these two stars individually then Arcturus becomes the third brightest star. For observers in northern latitudes Arcturus is second only to the brightest star in the night sky Sirius who shines at a magnitude of -1.44.

This means Arcturus rules the evening Sky from late spring to mid-autumn during the time that Sirius is absent in the evening hours.

A further remarkable indicator of Arcturus' brightness is its daytime visibility having been spotted with the naked eye right at sunset. The great 19th century German visual observer JF Julius Schmidt claimed he saw Arcturus without optics 24 minutes before sunset.

If you are in mid-northern latitudes Arcturus crosses the Meridian at an altitude of roughly 65° however for those in Hawaii Arcturus appears to be nearly directly overhead. That is why Arcturus was such an important navigational aid to early Polynesian sailors who determine their latitude by noting what stars appeared on the Zenith. Between about 1219 and 1266 A.D. some of these South Pacific sailors found the Hawaiian island chain with Arcturus overhead so they knew they could use that star to return to these new lands.

Arcturus brightness stands out along with its Bright red color. Also Arcturus is known for its origin and its age. Our Sun is roughly 4.6 billion years. Astronomers estimate Arcturus to be 7.1 billion years old more than half the age of the universe itself.

Among the countless stars that travel within the Milky Way, Arcturus is tilted only slightly toward our galaxies equatorial plane. Astronomers feel it may be possible that Arcturus, along with 52 other stars that do the same thing, are from another Galaxy that collided with the Milky Way a very long time ago.

These insights come from astronomer Fred SCHAFF shared in Sky and Telescop Magazine.

Stars worth noting in the Night Sky this Month

This month the Milky Way is seen lying flat around the horizon so not clearly visible unless you look up to the Northeast highest part in Cygnus the Swan. However this position of the Milky Way gives us the sense of the Plane of the Galaxy. Plus, when looking Northeast toward Cygnus Galactic Center is to your right.

Also prominent this month is the constellation of the Virgin Priestess (a.k.a. Virgo) containing seven main stars. The most visible star in this group is the bright bluish white star Spica, meaning "spike of grain" reminding us we reap what we sew.

The Stellar Triangle is a perfect 30-60-90 degree right triangle and includes Regulus (in the constellation of the Lion), Spica (in the constellation of the Virgin Priestess) and Arcturus (in the constellation of Bootes).

Once each month the Moon illuminates Regulus and a few days later passes by Spica further energizing the lights codes from these stars. This is happening May 19 at the Last Quarter Moon (29 Leo) within one degree of Regulus (0 Virgo) and then the Moon catches up to Spica around May 23.

The image above features another triangle with Spica, Arcturus and Denebola the tail of the Lion becoming more visible this month rising later in the evening marking the tail of the Lion and featuring the bright star Denebola, 43 light years away.

Venus is traveling through the Sacred Hoop of Stars exiting on June 23.

The Sacred Hoop of Stars (as they were known to the Lakota Sioux and other Plains Indians) are dropping lower in the western sky after Sunset. This configuration of stars is what astronomer's sometimes call the 'winter hexagon' though the Sacred Hoop includes the Pleiades on the outer edge rather than Aldebaran, the eye of the Bull. The top star of the Hoop this month is Capella and moving clockwise includes the Pleiades, Rigel, Sirius, and Procyon, and Pollux and Castor.

The Ecliptic (plane of the solar system and the path the planets travel) and the Milky Way (plane of the galaxy) intersect near the middle of this hoop of Stars forming a cross within a circle. The place of the intersection occurs at what is called the Galactic Edge, where we look out beyond our Galaxy. The center point of the cross is located between the feet of the Twins and the horns of the Bull. This intersection is the place in the sky where the summer solstice (0 degree Cancer) is currently located.

Orion and the Hyades are located inside the Sacred Hoop and are easily spotted this time of year. Interestingly, the Mayans perceived the sword of Orion as a sacred fire of creation inside a fire pit. Modern astronomers have discovered this is a place where new stars are being birthed!

Here is a new article I just posted on Mercury Miscommunication Challenges that can happen at anytime but are often heightened in Mercury Retrograde.

Note: All the events listed in the Celestial Timings have a minimum three day impact including the day before and the day after. In many cases, the planetary effects extend into weeks, months and even years. Noting the sign and degree of the aspects and planets helps you to know if these events are directly affecting your own natal chart. The Celestial Timings then are a great guide to sensing into how these energies affect us collectively and also when to pay extra close attention to the personal initiations we all go through.
